

## **ABSTRACT OF THE DISCLOSURE**

An electrical connector is bonded to a circuit board by solder materials. The solder materials are well arranged so that no short circuits occur. The electrical connector can be applied in a wide range of uses with high yield and reduced cost.

- 5 The electrical connector has an insulator having a plurality of terminals and a solder material therein. The electrical connector is characterized by the insulator being provided with a plurality of overflow holes in a direction along which the insulator and terminals apply pressure to the solder material.
